TITLE:

The Effect of Two-Arc Welding Parameters on the Fusing of Electrodes and Base Metal (Vliyaniye rezhima dvukhdugovoy svarki na pлавleniye elektrodov i osnovnogo metalla)

PERIODICAL:

Svarochnoye proizvodstvo, 1958, Nr 11, pp 15-16 (USSR)

ABSTRACT:

For the purpose of introducing two-arc welding process with a 2 mm electrode rod into shipbuilding, the author carried out experiments consisting in the welding of beads by two arcs in one welding bath with the use of a low-carbon "Sv-GSA" electrode rod 2 mm in diameter and "AN-348A" flux. The welding technology is described, and the parameters are given (Table 1). Seam shape parameters (Table 2) permit the conclusion that the increased arithmetical mean value of currents on the first and second arcs entail an increased depth, width and area of melting, an increased height of protruding weld metal and a reduced seam shape coefficient. The use of 215 - 600 a current on the first arc and 209 - 520 a current on the second arc make it possible to weld metal 3 - 30 mm thickness.

TITLE: A Welding Conference of Pacific Coast Plants (Konferentsiya po svarke predpriyatiy Tikhookeanskogo basseyna)

PERIODICAL: Svarochnoye proizvodstvo, 1958, Nr 11, p 39 (USSR)

ABSTRACT: A welding conference of the Pacific coast plants convened at Vladivostok by the Scientific Technical Section of Water Transports. The following reports were delivered: Engineer V.N. Sherstyuk on "Further Development of Welding Practice in Far-East Plants"; Dotsent, Candidate of Technical Sciences M.S. Kulikov on the repair welding of crankshafts; Dotsent, Candidate of Technical Sciences, N.V. Parabanov on a rational design of welded ship hulls; Engineer S.N. Agranomov on the use of the latest methods in semi-automatic and automatic welding processes; Alekseyev, Gubskiy, Yung, Mallopuro, Tsirkul'nikov, Kagner and other plant workers made various valuable suggestions on the further development of the welding process in Far-East plants. The Conference decided to

TITLE:

Features of Two-Arc Welding by Thin Electrode Wire

PERIODICAL:

Avtomaticheskaya svarka, 1959, Nr 9, pp 74-80 (USSR)

ABSTRACT:

Arc-welding under flux by thin electrode wire having a diameter of 1.6-2 mm can be performed either by using one common puddle or separate puddles (Fig 1). Welding by two arcs with a common puddle, it is possible to change considerably the parameters of welded joints, and to receive welds possessing the required mechanical properties and chemical composition. That is why this method permits the elimination of cracks and other defects in welds. Another advantage of it is the increased speed of the welding process. Two-arc welding is applied in serial manufacture of tubes, repairing of railroad cars and ships, and of other constructions. When welding with a common puddle, the resulting action of two arcs depends on their voltage, inclination angles, and the distance between them; all these

Card 1/3

00Y/125-50-9-10/16

Features of Two-Arc Welding by Thin Electrode Wire

parameters can be changed at will, thus enabling control of the fusion depth. The optimum distance selection between the arc depends on the condition of welding; it can be pre-calculated. The speed of welding is 20 to 60 m/hour. Table 2 gives conditions which may be applied for welding of fillet- and groove joints. Evaluation of welding conditions is seen from Table 3. Analysis of figures shows that with augmentation of the first and second arc current intensity, the fusion depth increases. Table 4 gives figures pertaining to the influence of welding conditions on distribution of heat energy when welding by two arcs in a common puddle. Elevation of welding speed entails an increase of heat consumption for base metal melting, while for electrode wire and flux melting, the heat consumption is reduced, as the welding speed increases. There are 4 tables, 2 diagrams and 14 Soviet references.

Glucose and insulin added together to the medium cause a considerable increase of phagocytic activity of leucocytes of human blood. Glucose and insulin added separately decrease this activity. Elimination of glycolysis induced by the addition of iodoacetic acid likewise diminishes phagocytosis: this effect is abolished by the addition of lactic acid. The phagocytic activity of leucocytes depends to a great extent on their carbohydrate metabolism.

SOV/48-23-9-28/57

AUTHORS: Ivanov, L. M., Sheradilo, A. I.

TITLE: A Photoelectric Attachment for Spectrographs of Medium
Size Models

PERIODICAL: Izvestiya Akademii nauk SSSR. Seriya fizicheskaya, 1959,
Vol 23, Nr 9, pp 1114 - 1115 (USSR)

ABSTRACT: This photoelectric attachment was developed for spectrographs
of the type ISP-22, and figure 1 shows an optical scheme of
this arrangement. In the focal plane of the spectrograph a
quartz plate is arranged, on which, in an impermeable alumi-
num layer transmissive slits are provided. The light incident
through the slits is deflected to photoelectric cells of the
type STsV-6 by means of mirrors. An automatic thermostat pre-
vents a thermal shifting of the lines, and, by means of a suit-
able construction, a shifting of the lines in the case of a
variation of a slit width is prevented. In this way it is
possible, when passing over to a new program, to avoid the
time-consuming adjustment necessary for finding the desired
lines. Further, the authors developed a special apparatus for
the cutting of the passage slits according to a given spectro-

Card 1/2

A Photoelectric Attachment for Spectrographs of
Medium Size Models

SOV/8-23-9-20/57

gram, in which case cutting of the slits is carried out at the moment when the desired line is recorded photoelectrically at the slit of the microphotometer. The minimum distance between slits is 0.01 mm, and the shifting between the centers of the slit and the line amounts to 1-2 μ . In conclusion, the mode of operation of the device is discussed. After establishment of thermal equilibrium the relative line intensities are unchanged with respect to time, and the signals in the various channels are in the range of 0.5 - 2.5 v. The errors in the reproducibility of the intensity of ratios of several iron lines amounted to about 0.5 - 0.7%. There are 2 figures and 2 references, 1 of which is Soviet.

TITLE: Radioisotopic device¹⁹ for measuring pressure and rarefaction. Class 42,
No. 173994

9M

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 16, 1965, 99

TOPIC TAGS: radioisotope, pressure gage, ionization detector, ionizing radiation,
gas ionization, *nuclear physics apparatus, physics laboratory instrument*

ABSTRACT: This Author Certificate presents a radioisotopic device for measuring pressure and rarefaction. The device contains a sensitive unit in the form of a sealed flexible reservoir of variable volume, enclosed in a protective jacket and open to the medium the pressure of which is to be measured (see Fig. 1). To increase the measurement accuracy of the parameter under investigation, the variable volume reservoir is filled with a radioactive gas and is connected to a constant volume reservoir. The latter is provided with a detector of ionizing radiations. The detector is acted upon by the nuclear radiation from the atoms of the

PURPOSE AND COVERAGE: This book is intended for engineering personnel of machine-building plants, scientific research institutes and plant laboratories. It may also be useful for students of schools of high technical education specializing in technology. The book reviews the most important problems of heat generation in the process of machining various aircraft materials and its effect on material machinability. New methods of machining procedure are discussed on the basis of analysis of physical and mechanical properties of materials. Theoretical analysis of heat-affected zones in machining is presented along with examples of its calculation. Also discussed are specific thermal phenomena and the process of machining light-weight and copper alloys at a speed up to 10,000 m/minute. Separate chapters are devoted to an analysis of thermal phenomena and machinability relative to gear thread-ing at thread grinding. Chapters I and IV are written by Docent P. I. Bobrik, Cand. of Tech. Sciences; Ch. II. by Docent A. I. Belousov, Cand. of Tech. Sciences; Ch. III by Docent L. A. Khvorostukhin, Cand. of Tech. Sciences; Ch. V. by Docent S. S. Silin, Cand. of Tech. Sciences; Ch. VI. by Docent N. V. Uspensky; Ch. VII by V. I. Sheryshev, Cand. of Tech. Sciences; and Ch. VIII by A. Z. Rakhman-Zade, Cand. of Tech. Sciences.

AUTHOR: Sheryshev, V.I.

TITLE: Force and temperature dependences in milling gears made from refractory and titanium alloys.

PERIODICAL: Stanki i instrument, no. 2, 1963, 33-35.

TEXT: Involute spur gear hobbing experiments on 3M 827 (K1827) and BT 14 (V114) alloys were conducted to study the dependence of the cutting force and temperature on the cutting speed and depth, feed, chip volume, and tool wear. Hobbing was conducted on a 5532 (5B32) gear hobbing machine of the "Komsomlets" Plant, with hobs of P 18 (R18) steel and sulfofrezol for cooling. The cutting temperature was measured by the natural thermocouple method, with slip rings placed on the hob and on the gear; the mean temperature was recorded by a millivoltmeter, and instantaneous temperatures by a loop oscillograph. At the same time, the cutting force was measured by a dynamometer with strain gages and recorded by a milliammeter and a loop oscillograph. The experiments are described, and the data given in graphs and a table. The data show that the cutting force and temperature are 2-5 times higher for the alloys than for 40X (40Kh) steel, feed has a

TITLE: Gear-milling of cylindrical straight-toothed wheels from alloys EI827 and VT14

SOURCE: Moscow. Aviatsionnyy tekhnologicheskii institut. Trudy, no. 60, 1964.
Povysheniye resursa raboty aviatsionnykh detaley tekhnologicheskimi sredstvami
(Increasing the efficiency potential of aircraft parts by technological procedures), 50-59

TOPIC TAGS: gear milling, hobbing cutter, cutter wear, heat resistance alloy, titanium
alloy, gear tooth wear alloy EI827, alloy VT14

ABSTRACT: The author calls attention to the ever greater industrial use, particularly in the newer technological areas, of materials having special, improved characteristics and properties such as resistance to heat and corrosion, but which at the same time are distinguished by poor machinability. The present article considers a specific technological index, or criterion, of machinability - the tooth wear in hobbing cutters and the effect of this wear on the accuracy with which gear wheels can be manufactured from heat-resistant and titanium alloys. Serving as the object of the investigation were straight-toothed cylindrical gear-wheels of external evolvent engagement, manufactured of heat-resistant alloy EI827 and titanium alloy VT14; the number of teeth per wheel was 38, the

modulus 1 mm, and the length of the tooth to be cut - 10 mm. The study was made on a model 5B32 gear-cutting machine of the "Komsomolets" plant. Single-cut hob cutters (Class A, GOST 9324-60), manufactured of R18 fast-cutting steel with a hardness of HRC = 62-65, were employed as the cutting tools. Further details with respect to the test procedure are given in the article. In order that the experiment approximate actual production conditions as closely as possible, it was conducted directly on the milling machine, using a device in which the optical system, somewhat modified, was adapted from a PMT-2 instrument (used in the measurement of micro-hardness). This device made it possible to measure wear over the forward and rear surfaces of the tooth. Considerable attention is paid in the article to an attempt at establishing the permissible degree of hob cutter tooth wear as a function of the accuracy of the gears manufactured. Curves are presented which illustrate the change in maximum cutter tooth wear with time depending on various given parameters, and also the distribution of wear for all the teeth of the cutter. Using a grapho-analytic method for the processing of experimental data, the author was able to establish various mathematical expressions reflecting the reactions of both alloys to various factors resulting in wear. On the basis of the results obtained in this study, various machining recommendations are advanced which take into consideration the specific behavior of the alloys in terms

AUTHOR: Andreyev, G. Ya.; Sherzhukov, G. Ye.; Shevchenko, V. Ya.; Dardysk, Ya. I.

TITLE: New technique and equipment design for the preparation of glass-reinforced plastic pipe by a continuous method

CITED SOURCE: Nauchn. tr. Khar'kovsk. gorn. in-t, v. 12, 1962, 126-136

TOPIC TAGS: pipe manufacture, plastic pipe, glass reinforced pipe, glass reinforced plastic pipe

ABSTRACT: The essence of the new technique is that layers of longitudinal and transverse-glass fibers, impregnated with a binder during the process, are placed on a small length in the shaping zone of a pitch mandrel. To effect longitudinal movement of the pipe, the mandrel is composed of separate longitudinal sections, forming a cylinder when assembled, and able to move forward and backward. The sections move synchronously in the axial direction and cause the pipe to move along, after which each section is extracted from the pipe to return to its initial position, while the backward motion of the pipe is checked. The use of different variations of the assembly design permits manufacture of pipes with varying wall

Card 1/2

ACCESSION NR: AR4033715

thickness (from 0.5 to 1.5 mm) and a conical outer surface, while the use of changeable pitch mandrels ensures the production of pipes of varying internal diameter (75, 100, 125, 150, 300 mm) and length (as required). The productivity is up to 30 m/hr. Diagrams, technical characteristics, a description of the assembly and the advantages of its employment are given.

Production of glass fiber reinforced plastic pipes (Isgotovleniye stekloplastiko-vykh trub), Khar'kov, Izd-vo Khar'kovskogo univ., 1964, 98 p. illus., biblio, 9,000 copies printed.

TOPIC TAGS: glass fiber, reinforced plastic, tube

PURPOSE AND COVERAGE: This book presents the technology of continuous fabrication of glass fiber reinforced plastic tubes developed in the Khar'kov Mining Institute. It describes in detail the equipment for producing tubes by the continuous method. The reader can more fully conceive of the newness and advantages of this method of fabricating glass fiber reinforced plastic tubes from the review of present methods in the USSR and abroad. At the same time, the book presents information on the various types of glass fillers and binders in use in the production of glass fiber reinforced plastics. The book is intended for a wide audience of engineers, technicians, workers in research and design institutions, students in VUZI and technicums, and production innovators.
